Outlook of the Talk

- Logic of Paradox and Game Semantics
- First-Degree Entailment and Game Semantics
- Relevant Logic and Game Semantics
- Belnap's Logic and Game Semantics

What is Hintikka's Game Theoretical Semantics? I

The *semantic verification game* is played by two players, traditionally called Abelard (after \forall) and Eloise (after \exists), and the rules are specified syntactically.

During the game, the given formula is broken into subformulas by the players step by step, and the game terminates when it reaches the propositional atoms.

If we end up with a propositional atom which is true in the model in question, then Eloise wins the game. Otherwise, Abelard wins.

Classical Game Theoretical Semantics for Negation

What is Hintikka's Game Theoretical Semantics? II

We associate conjunction with Abelard, disjunction with Heloise. In negated formulas, players switch their roles. Abelard takes up Eloise's verifier role, and Eloise becomes the falsifier.

The major result of this approach states that Eloise has a winning strategy if and only if the given formula is true in the model.

What is Hintikka's Game Theoretical Semantics?

During the game, the given formula is broken into subformulas by the players **step by step**, and the game **terminates** when it reaches the propositional atoms.

If we end up with a propositional atom which is true in the model in question, then Eloise wins the game. **Otherwise**, Abelard wins. We associate **conjunction with Abelard**, **disjunction with Heloise**.

The major result of this approach states that Eloise has a winning strategy **if and only if** the given formula is true in the model.

Classical Game Theoretical Semantics for Negation

Questions for Game Semantics?

Questions

- How can we give a game semantics for non-classical logics?
- What are the elements in the semantic games we need to alter to make room for non-classical logics?
- How do non-classical logics reflect on the game semantics?
- Do non-classical logics produce non-classical games?

Classical	LP	FDE		
000000				
Classical Game Theore	etical Semantics for Negati	on		

Non-classical Games

We consider the following five non-classical / non-zero sum possibilities:

- 1. Abelard and Eloise both win.
- 2. Abelard and Eloise both lose.
- 3. Eloise wins, Abelard does not lose.
- 4. Abelard wins, Eloise does not lose.
- 5. There is a tie.

Classical oooo●o	LP 0000000	FDE 0000000		
Classical Game Theoret	ical Semantics for Negation	on		

Non-classical Games

Some propositions can belong to both player: namely, both the proposition and its negation can be true.

Some propositions can belong to the neither: namely, neither the proposition nor its negation can be true.

Some propositions may not belong to one player without the negation belonging to the opponent: namely, the proposition can be true, but its negation may not be false.

A B > 4
 B > 4
 B

Classical oooooo	LP 0000000	FDE 0000000		
Classical Game Theore	tical Semantics for Negation	on		

Non-classical Games

In short, the game does not have to be a zero-sum game.

One's win may not imply the other's loss.

We can also focus on the games where players play simultaneously, as opposed to take their turns.

What about games that are not determined - the ones without a winner?

Logic of Paradox					

Logic of Paradox and GTS

Consider Priest's Logic of Paradox (LP) (Priest, 1979). LP introduces an additional truth value *P*, called *paradoxical*, that stands for both true and false.

Logic of Paradox				

Game Rules for LP

The introduction of the additional truth value *P* requires an additional player in the game, let us call him *Astrolabe* (after Abelard and Heloise's son).

Since we have three truth values in LP, we need three players that try to force the game to their win. If the game ends up in their truth set, then that player wins.

Classical	LP	FDE		
	000000			
Logic of Paradox				

Game Theoretical Semantics for LP

Consider the conjunction. Take the formula $p \land q$ where p, q are P, F respectively.

Abelard makes a move, and as the falsifier, he chooses q which is false. This gives him a win. Interesting enough, Astrolabe also makes a move and, chooses p giving him a win. In this case both have a winning strategy. Moreover, the win for Abelard does not automatically entail that it is a loss for Astrolabe.

Game Semantics: A Paraconsistent Approach

Classical	LP	FDE

Logic of Paradox					

Correctness

Theorem

In GTS^{LP} verification game for φ ,

- Eloise has a winning strategy if φ is true
- Abelard has a winning strategy if φ is false
- Astrolabe has a winning strategy if φ is paradoxical

Classical oooooo	LP 00000●0	FDE 0000000		
Logic of Paradox				

Correctness

Theorem

In a GTS^{LP} game for a formula φ in a LP model *M*,

- If Eloise has a winning strategy, but Astrolabe does not, then φ is true (and only true) in M
- If Abelard has a winning strategy, but Astrolabe does not, then φ is false (and only false) in M
- If Astrolabe has a winning strategy, then φ is paradoxical in in M

Classical oooooo	LP 000000●	FDE 0000000		
Logic of Paradox				
Weake	ning			

For a biconditional correctness result, we need to introduce *priorities* in play to the game. For example:

Consider $p \lor q$ where p, q has truth values P, Frespectively. So, $p \lor q$ has truth value P. In this case, Eloise cannot force a win because neither p nor q has the truth value T. On the other hand, Astrolabe has a winning strategy as the truth value of p is P when it is his turn to play. Thus, he chooses p yielding the truth value P for the given formula $p \lor q$.

Classical	LP	FDE		
		●000000		
First-Degree Entailemer	ıt			

First-Degree Entailment

Semantic evaluations are *functions* from formulas to truth values.

If we replace the valuation function with a valuation *relation*, we obtain *First-degree entailment* (FDE) which is due to Dunn (Dunn, 1976).

We use φ **r**1 to denote the truth value of φ (which is 1 in this case).

Since, **r** is a relation, we therefore allow $\mathbf{r}(\varphi) = \emptyset$ or $\mathbf{r}(\varphi') = \{0, 1\}$ for some formula φ, φ' .

Thus, FDE is a paraconsistent (inconsistency-tolerant) and paracomplete (incompleteness-tolerant) logic.

First-Degree Entailment

For formulas φ, ψ , we define **r** as follows.

eg arphi1	iff	arphir0
eg arphir0	iff	arphir1
$(\varphi \wedge \psi)$ r1	iff	$arphi$ r1 and ψ r1
$(\varphi \wedge \psi)$ r0	iff	$arphi$ r0 <i>or</i> ψ r0
$(\varphi \lor \psi)$ r1	iff	$arphi$ r1 <i>or</i> ψ r1
$(arphi \lor \psi)$ r0	iff	$arphi$ r0 and ψ r0

• • • • • • • • • •

Classical	LP	FDE			
		000000			
First-Degree Entailement					

First-Degree Entailment and GTS

The truth values $\{0\}, \{1\}$ and $\{0, 1\}$ work exactly as the truth values *F*, *T*, *P* respectively in LP. In fact, LP can be obtained from FDE by introducing a restriction that no formula gets the truth value \emptyset .

Recall that for GTS^{LP}, we allowed parallel plays for selected players depending on the syntax of the formula: we associated conjunction with Abelard and Astrolabe, disjunction with Heloise and Astrolabe.

Classical	LP	FDE			
		0000000			
First-Degree Entailement					

First-Degree Entailment and GTS

For FDE, the idea is to allow each player play at each node as FDE uses valuation relations as opposed to valuation functions.

Therefore, it is possible that both players (or none) may have a winning strategy.

Also, notice that allowing each player play at each node does not necessarily mean that they will always be able to make a move. It simply means, it is allowed for them to move simultaneously.

First-Degree Entailement					

First-Degree Entailment and GTS: An Example

Consider two formulas with the following relational semantics: $\varphi \mathbf{r} \mathbf{0}$, $\varphi \mathbf{r} \mathbf{1}$ and $\psi \mathbf{r} \mathbf{1}$. In this case, we have $(\varphi \land \psi)\mathbf{r} \mathbf{1}$ and $(\varphi \land \psi)\mathbf{r} \mathbf{0}$.

We expect both Abelard and Heloise have winning strategies, and allow each player make a move at each node.

Theorem

In a GTS^{FDE} verification game for a formula φ , we have the following:

- Heloise has a winning strategy if φr1
- Abelard has a winning strategy if φr0
- No player has a winning strategy if $\varphi \mathbf{r} \emptyset$

Classical oooooo	LP 0000000	FDE 0000000	RR ●00	
Relevant Logic				

Routleys' Relevant Logic

An interesting way to extend the relational semantics is to add possible worlds to the model. The idea is due to Routley and Routley (Routley & Routley, 1972).

A *Routley model* is a structure $(W, \#, \mathbf{r})$ where *W* is a set of possible worlds, # is a map from *W* to itself, and \mathbf{r} is a valuation from $W \times \mathbf{P}$ to $\{0, 1\}$ assigning truth to propositional variables at each world.

Let us now give the semantics for this system.

$$\mathbf{r}(w, \varphi \land \psi) = 1 \text{ iff } \mathbf{r}(w, \varphi) = 1 \text{ and } \mathbf{r}(w, \psi) = 1$$
$$\mathbf{r}(w, \varphi \lor \psi) = 1 \text{ iff } \mathbf{r}(w, \varphi) = 1 \text{ or } \mathbf{r}(w, \psi) = 1$$
$$\mathbf{r}(w, \neg \varphi) = 1 \text{ iff } \mathbf{r}(\#w, \varphi) = 1$$

Relevant Logic and GTS: Correctness

Theorem

For the evaluation games for a formula φ and a world *w* for Routleys' systems, we have the following:

- 1. Heloise has a winning strategy if φ **r**1.
- 2. Abelard has a winning strategy if φ **r**0.

Classical	LP	FDE		BL	
				•0 0 00	
Belnap's Four Valued Logic					

Belnap's Four Valued Logic

Belnap's four valued logic introduces two additional truth values: The truth value P represents the over-valuation, and N represents the under-valuation.

Classical	LP	FDE		BL	
				0000	
Belnap's Four Valued Logic					

Hereditary Condition

BL truth table looks rather *different*. For instance, $P \lor N$ yields *T*, and $P \land N$ yields *F*.

Definition

Let *L* be a *n*-valued logic where $n \ge 2$, $\{V_i\}_{i \le n}$ the set of truth-values, and $\{C_j\}_{j \in J}$ be set of binary logical connectives for some index set *J*. Then, *L* is said to have the hereditary condition if for all $i, i' \le n, j \in J$, $C_j(V_i, V_{i'})$ evaluates to either V_i or $V_{i'}$. In short, logical connectives cannot produce a truth value different than those of the input values. This definition can easily be extended to *k*-ary logical connectives.

Classical, intuitionistic logics, and LP, RR, FDE all possess the hereditary condition. BL does not have the hereditary condition.

Classical	LP	FDE	BL	
			00000	
Belnap's Four Valued Lo	ogic			

Belnap's Logic and GTS I

GTS can be considered as a history-based choice algorithm - a choice among what is given.

The hereditary condition relates the earlier moves to current moves with a perfect history. In BL, this does not seem to be possible.

In other words, if a logic does not have the hereditary condition, then the players cannot make a choice that can transfer the wins and losses to the subformulas.

The cases $P \land N = F$ and $P \lor N = F$ exemplify this situation. For a conjunctively false formula, Abelard cannot always choose the false conjunct, as there may not be a false conjunct

- yet the conjunction can still be false.

Classical 000000	LP 0000000	FDE 0000000		BL 00●00	
Belnap's Four Valued Logic					

Belnap's Logic and GTS II

Therefore, BL introduces another anomaly to verification games: imperfect history. This aspect of verification games is most certainly very interesting and might suggest various interesting tweaks in verification games.

Nevertheless, for the time being, we leave it as an open problem to give a GTS for BL.

Classical	LP	FDE	RR	BL	
Belnap's Four Valued Lo	gic				

Conclusion

I consider this work as a first-step towards paraconsistent game theory.

Behavioral economics and the charming examples it provides constitute an interesting playground for the ideas we have developed.

GTS for non-classical logics can be used as a tool in mechanism design which relates algorithmic game theory to game semantics. Our observations in Belnap's logic illustrates this point.
